Static vs. Dynamic Models

Two ways to understand a software system

■ STATIC MODEL

Focus: Structure — what the system contains.

Shows: Classes, objects, and their relationships.

Example: A class diagram showing how students, teachers, and courses are connected.

Think: *A blueprint of the system.*

■ DYNAMIC MODEL

Focus: Behavior — how the system works over time.

Shows: Actions, events, and interactions between parts.

Example: A sequence diagram showing what happens when a student logs in.

Think: *A movie of the system in action.*

STATIC		DYNAMIC
What is it made of?	≠	**How does it behave?**

Conclusion: Use both together for a clearer, more complete software design.
